## VOLUME X

[illegible]

The courts have decided that refusing to  
pay for newspapers and periodicals from the post-office,  
when they are unclaimed, is *prima facie*

On the basis of the FROGMARCH in 30  
of the United States.

## Editorial.

### THE CATTLE DISEASE

So far as we can judge the  
cattle disease has caused a  
considerable loss in this country  
and in Europe. But few  
diseases have been reported, and the  
loss, for the most part, where the  
disease is complicated with some other  
one, rather than this, if all the animals  
are healthy. There are very frequently  
cases of the disease, however, which  
kill in a few days, and which  
leave the feet tender for a  
week or more, and in cases of  
comparatively worthless for labor.  
But in this country, so far as  
we are anxious to know, the  
disease has not been reported. In  
many cases, the horns  
of the animals have been loosened, a few weeks  
will, no doubt, enable it to grow as  
again so as to prevent permanent  
loss.

It does not follow, however,  
because in any the less to be disre-  
garded if individual cases where the  
disease, from the waste of products  
and of cattle diseased, has amount  
to three thousand dollars. The  
loss is a good deal of hard labor

for a hard working farmer. It  
therefore, that the aggregate loss  
community from the visitation of this

The course the State government adopted to check and control it, must be regarded as wise and judicious. Data Commission was filled with very capable and reliable men. It was what there was to contend with, we not ill after the meeting of the State of Agriculture at Framingham. Commission appointed inspectors of signal markets for live stock, so that they could be allowed to pass out into the country and carry the virus. That was a great step to gain, and more than anything else to prevent the distribution of the virus. By the action of the masters of transportation, the virus was not spread, and the danger of contamination lessened. By keeping the informed of the progress of the disease, information as to the best way to pursue when the disease breaks farmers could do more to help them than they could the way we have begun earlier. Suppose there was competent medical character to conduct the actual character of the disease as it broke out, and before it spread, allowed to infect the yards and the individuals from Brighton. That perhaps, would not have been appreciable of such an officer, because it

been brought home to them in cases, but it is easy to see why

amount of property might have been saved had there been prejudice, as there is, against the colored people. As to the colored people, they are in the days of prosperity, and the community would have been a "care," and the loss to individuals in many cases had been averted.

New reign of cattle diseases have begun in this country. They threaten to sweep the old country in 1896, but have still a comparatively remote chance of being checked. We have enjoyed a great degree of our cattle herds, as a rule, been healthy. Few great epidemics have among them. There is reason to be anxious, for such immunity are over the herds, we are over more from the rising, increasing the risk of contagion, increasing the risk of contagion of stock raising, and the greater cause and better treatment would escape the effects of various to which cattle are subject.

Why are cattle have such an immunity? We have heard that we have alighted to a State of cattle a thoroughly competent veterinarian in adequate salary, who should be of the Cattle Commission, and who should be to visit various parts of the State, to see the different waterfalls, and to see the cattle in the State in large numbers.

Another thing is certain, that a number of competent veterinarians are needed.

proper treatment of them among

the course of veterinary instruction at the Agricultural College. It is, no doubt, what there is of it, but we do not think enough of it. It would be a thing for the community if every one that leaves the college were capable of a helping hand, that here have supported unless the course of instruction made more thorough, complete and wise? The Agricultural College always has been of a Veterinary College and it can do it to a great extent and it can do so to the community. It is quite time that we had a college of a high character in this. It is time that the profession were in a higher position of dignity and respect that the community looked upon the college as a thorough and scientific establishment. It is required to lead to this.
